UNEARTHING THE ENVIRONMENTAL IMPACT OF HUMAN ACTIVITY: A GLOBAL CO2 EMISSION ANALYSIS

INTRODUCTION

Over view

Global warming is one of the biggest challenges currently being faced by the human race, although correlation is not causation, a likely cause of global warming is due to increased atmospheric carbon dioxide from human activities. CO2 Emission refers to the carbon dioxide emitted throughout the world. For this analysis we will be focusing on CO2 Emission and its effects on the world we live in as well as some key factors and stats that may play a role in emission of CO2 globally.

Fossil fuel use is the primary source of CO2. This project throw light onto how much fossil fuels are burnt, per year, per nation, which
